

# Testing Overview

The Model Metrics JavaScript Synch Engine (MMJSE) provides Jasmine tests to ensure code quality that can be integrated into continuous integration (CI) processes.

Jasmine is a behavior-driven development framework that provides 'spec's to test javascript functionality and logic assumptions. Additional information can be found at: <http://pivotal.github.com/jasmine/>

Jasmine tests can either be run through:

- a browser
- or through a 'headless' browser for automated testing.

Running the tests in the browser would be suitable for development or on a case by case basis. Where a CI process (such as Jenkins) could be utilized to give system wide results and integrate with other processes (such as documentation).

## Running From the Browser

To run the tests from a local machine, simply open **tests/runner/spec-runner.html** in your browser.

|  |  |  |
|--|--|--|
| Jasmine 1.2.0 revision 1337005947  |  | Show <input checked="" type="checkbox"/> passed <input type="checkbox"/> skipped |
| 38 specs, 0 failures in 0.044s Finished at Wed Oct 31 2012 11:26:10 GMT-0500 (CDT) |  | run all  |
| Stubs are correctly loaded   |  | run  |
| Connection is expected to be found   |  | run  |
| navigator is expected to be found  |  | run  |
| navigator.network is expected to be found  |  | run  |
| navigator.network.connection is expected to be found                               |  | run  |
| navigator.network.connection.type is expected to be found                          |  | run  |
| the ElementMover object  |  | run  |
| instantiation  |  | run  |
| throws an exception if you forget "new"  |  | run  |
| moving around two divs   |  | run  |
| adding a third div to the mix  |  | run  |
| moves div1 betwixt div2 & div3   |  | run  |
| moves div3 before div1   |  | run  |
| initially sees that div1 is above div2   |  | run  |
| moves div1 after div2  |  | run  |
| moves div2 before div1   |  | run  |
| Test MetadataVO  |  | run  |
| tests that instantiating when passing arguments works properly                     |  | run  |
| tests that instantiating when passing arguments nulls properly                     |  | run  |
| Environment sanity testing   |  | run  |

Note the different sections:

- By default, only failures are shown. Clicking the appropriate checkboxes allow showing successful tests (including those passed) and skipped tests
- Tests are grouped by 'describe' headings, with individual assertions found below.

Modifying those tests and refreshing (occasionally holding down SHIFT+Refresh to ignore cache) will then run the tests again.

## Continuous Integration (CI)

PhantomJS is headless WebKit environment with JavaScript API. More information can be found at: <http://phantomjs.org/>

An Apache Ant <http://ant.apache.org/> 1.8+ project has been created to simplify running those tests.

## Installing PhantomJS

PhantomJS provides a number of ways to install, and many can be found on their installer page: <http://phantomis.org/download.html>

PhantomJS can also be installed with a number of package managers, such as: homebrew or macports. (The item to be certain is that it is 1.6+) Apt-get installs v1.5, which uses a different syntax to load.

Using Mac Ports

```
sudo port install phantomjs
```

Using Homebrew

```
brew install phantomjs
```

## Installing Apache Ant

Installers for Apache Ant can be found here: <http://ant.apache.org/bindownload.cgi> - and can be installed either through binary (pre-compiled) or source code.

Users on a Macintosh will likely already have Apache Ant already installed, although this will likely be an older version (but still suitable).

Package managers could also be used, although can vary by difference.

Apt-Get

```
apt-get install ant
```

Mac Ports

```
port install apache-ant
```

HomeBrew

- Please see the following page: <http://seventy6.com/post/14175174562/how-to-upgrade-apache-ant-to-1-8-2-on-osx-using>

## Running PhantomJS

Once both PhantomJS and Apache Ant are installed, simply navigate to the base directory in your terminal and run the following command:

```
$>ant
```

```

run_jasmine:
[exec] Attempting to open page: file:///Users/proth/Documents/work/modelmetrics/projects/jsSynchEngine/dev/MM-Javascript-Synch-Engine/tests/runner/sp
[exec] MMSync :: buildQuery() => Building query for Account
[exec] MMSync :: buildQuery() => Building query for Account
[exec] MMSync :: buildQuery() => Building query for Account
[exec] MMSync :: buildQuery() => Building query for Account
[exec] MMSync :: buildQuery() => Building query for Account
[exec] MMSync :: buildQuery() => Building query for Account
[exec] MMSync :: buildQuery() => dateString for Account is 2012-10-31T14:00:10.752-05:00
[exec] MMSync :: buildQuery() => Building query for Account
[exec] MMSync :: buildQuery() => dateString for Account is 2012-10-31T14:00:10.752-05:00
[exec] Network is offline
[exec] Network is online
[exec] Network is online
[exec] Network is offline
[exec] Network is offline
[exec] Network is online
[exec] Network is offline
[exec] Network is online
[exec] Network is online
[exec] Network is online
[exec] Network is offline
[exec] 'waitFor()' finished in 200ms.
[exec]
[exec]
[exec] 38 specs, 0 failures in 0.025s
[echo] Tests did not fail

BUILD SUCCESSFUL
Total time: 1 second

```

Note: console.log messages are echoed out to the console, such as 'Network is offline' in the previous image and can be used to debug statements.

However - console.log messages should be commented out to avoid polluting the test information if not needed.

## Working with Tests

All tests should be found under the **tests/** directory, with the following sub folders:

- specs - Jasmine Spec tests
- runner - Code used to run Jasmine tests among other CI tasks
- mocks - Code stubs used to bridge, overwrite or stem certain functionality needed for testing. (Such as missing functionality commonly found in Mobile but not in PhoneGap)
- dataStubs - JSON stub data used to mock data returned from Salesforce.com

### Spec-Runner.html

**New files (specs, stubs or data stubs) must be added to the tests/runner/spec-runner.html file.**

This file specifies the javascript files to include and often requires the javascript files to be included in a very specific order.

This ensures that they are available to Jasmine, so they can be used in running the tests.
